A. Student and team particulars

Name / Student ID	DING ZIXIN (G2602715D),
Undergrad University / Degree	University of Nottingham Ningbo China
Partner's name and ID (if any)	PAN SHENGXIN (G2601614B)
Tentative Plan after NTU Master	Work(DING ZIXIN), Phd(PAN SHENGXIN)

B. Links (leave blank if not applicable)

Your CV Online and Github page	https://github.com/398-21 https://github.com/SpectateurLinlan
Online repository (e.g., Github code, data, tools)	https://github.com/398-21/ultrasound_Model https://github.com/SpectateurLinlan/pharmascan-care-agent
Demo or presentation video	https://davidpansx-pharmascan-api.hf.space/ui/
Overleaf / report link	https://www.overleaf.com/project/6adb1c899a50a1c044ce836a
LecTrace script or trace link	https://398-21.github.io/ultrasound_Model/#/?trace=01_pharmascan

Most relevant software tool in project	PyTorch
Your project extends Assignments 1 or 2?	No

Describe the software bug in your deep learning program (e.g., Pytorch, Tensorflow or ConvNetJS Javascript etc) that cost you the most time. How did you find it, and how did you know it was fixed? Did AI coding agent help you to find bugs?
During the evaluation of the e-pill identification feature using the Hugging Face interactive deployment page, the model unexpectedly detected multiple pills within a single-pill image. After investigating this behavior, we consulted the AI to understand the root cause and successfully implemented its recommended fix to resolve the issue.

Which of the Lecture Videos (https://www.youtube.com/playlist?list=PLORG7zBQosxw) can be improved and why?
Lecture 4 Advanced Vision Models for Medical Imaging can be better if it can cover some of the advanced models in the related field of research, it would be helpful for students to learn and study how to improve their own work during the execution of this project

C. LecTrace — execution-explanation presentation

Approximate time spent learning LecTrace	2-3 hours
LecTrace script written by yourself or mostly by AI?	Script drafting attempted with AI; manually reviewed.

Q. Which execution states did you choose to show, and why those rather than others?
We selected four execution states: image cropping and backbone features, capsule routing and embedding refinement, personal-gallery matching, and catalogue re-ranking with imprint evidence. These states connect the input photograph to the final decision and expose the quantities that explain it: routing weights, prototype similarities, rejection thresholds, candidate ranks and confidence. An enrolled medicine and a foreign pill illustrate both acceptance and rejection. Large backbone computations were precomputed, while the subsequent calculations run live, keeping the presentation focused on interpretable decision steps rather than lengthy tensor operations.

Q. What was confusing or missing in LecTrace, and what one feature would you improve or add?
Changes to helper files required manual deletion of the static-build cache. We would add automatic dependency tracking and cache invalidation, with a visible rebuild status, so the displayed trace clearly reflects the latest code.

By default, you consent to your anonymised answers being used in research on teaching. Let me know if otherwise. This choice doesn't affect your grade.
